

Fishing Line Replacement

This guide will show its readers how to string and prepare a fishing line.

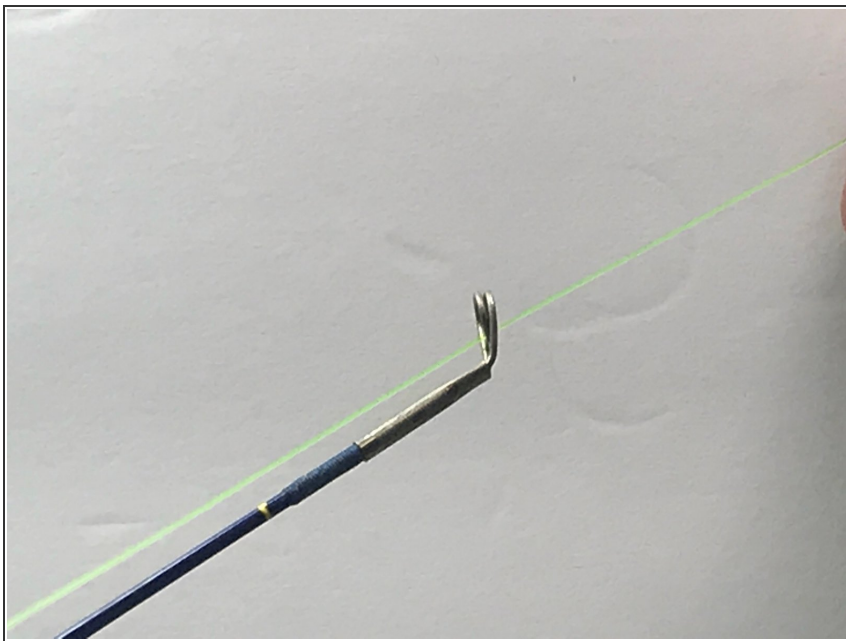

Written By: Trevone Martin

INTRODUCTION

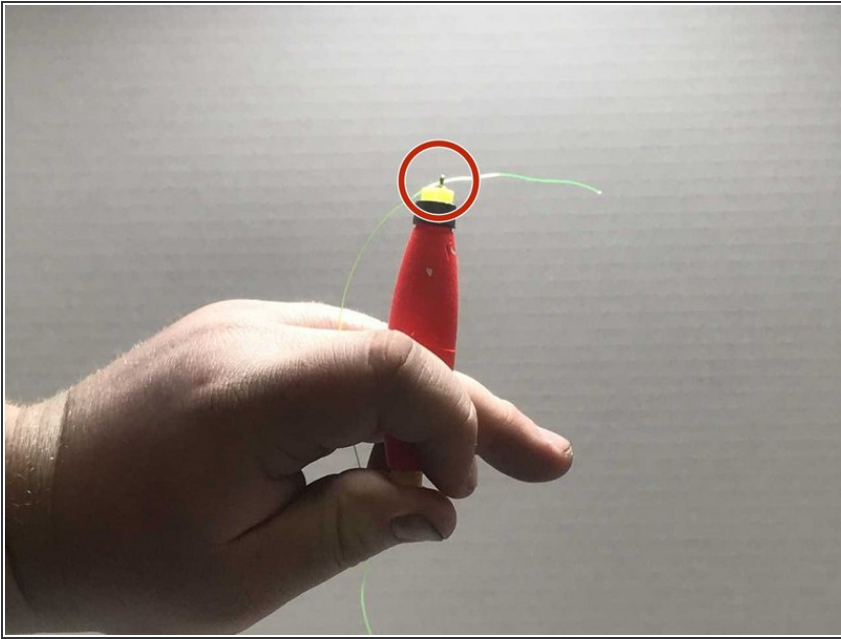

When fishing, it is very easy for a bigger catch to over power the fisher and break their line. This guide serves to show how one can restring a fishing line after it has been snapped. The only special requirement this guide needs is that the spool must still be intact and functioning correctly.

Step 1 — Fishing Line

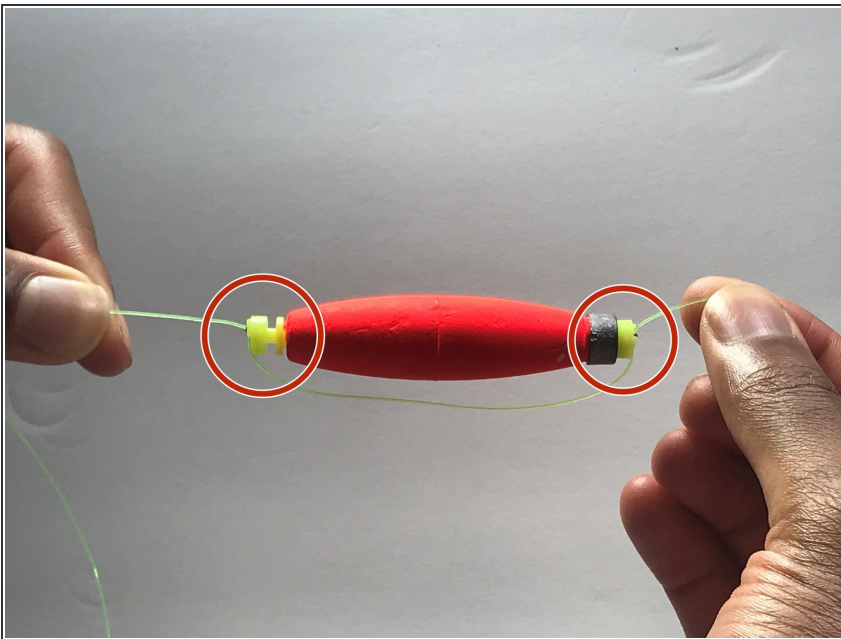

- Thread fishing line through all eyelets on the fishing pole.

Step 2

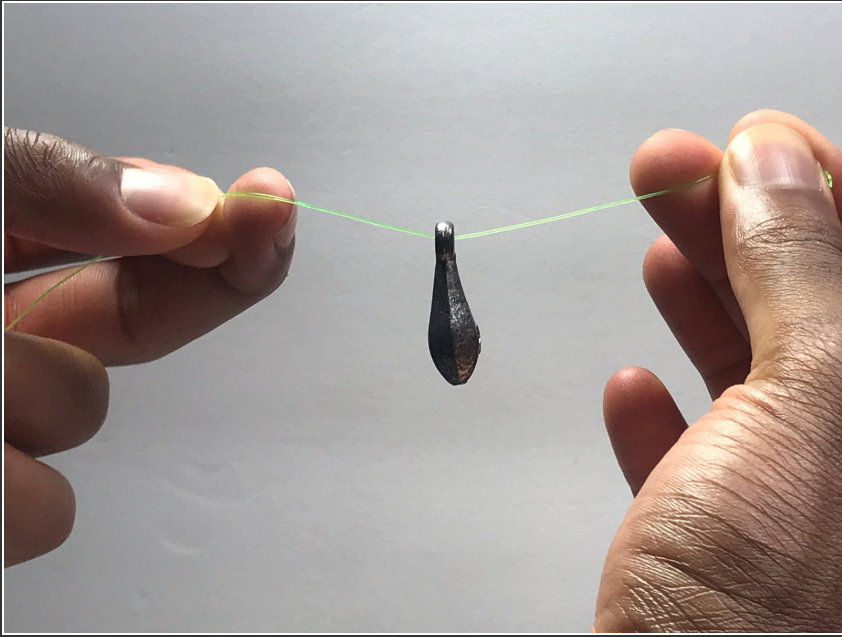

- At the top of the allotted seven to ten feet, thread the line through one hook of the bobber by depressing the opposite side of the bobber so that the hook is exposed.

Step 3

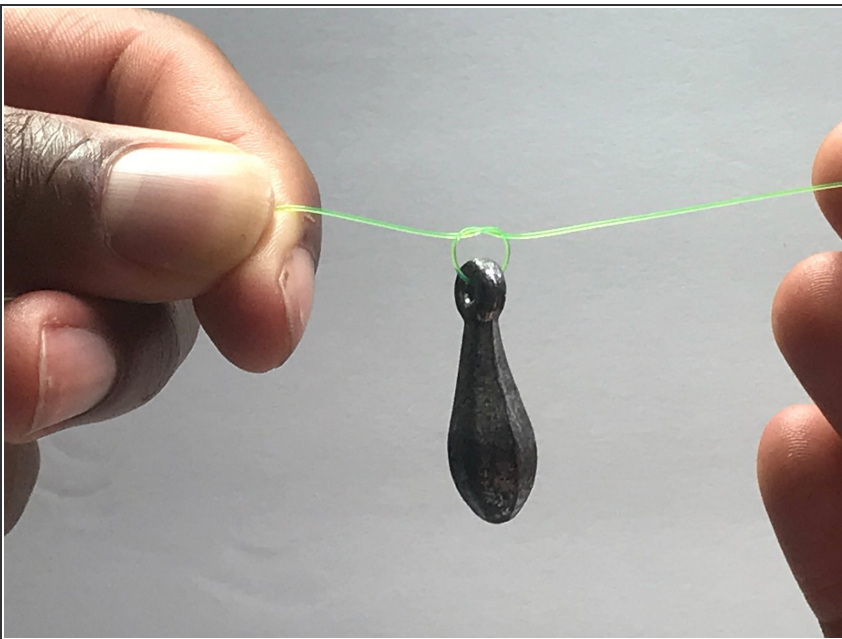

- Repeat step two for the opposite end of the bobber, threading the line through the second hook.

Step 4

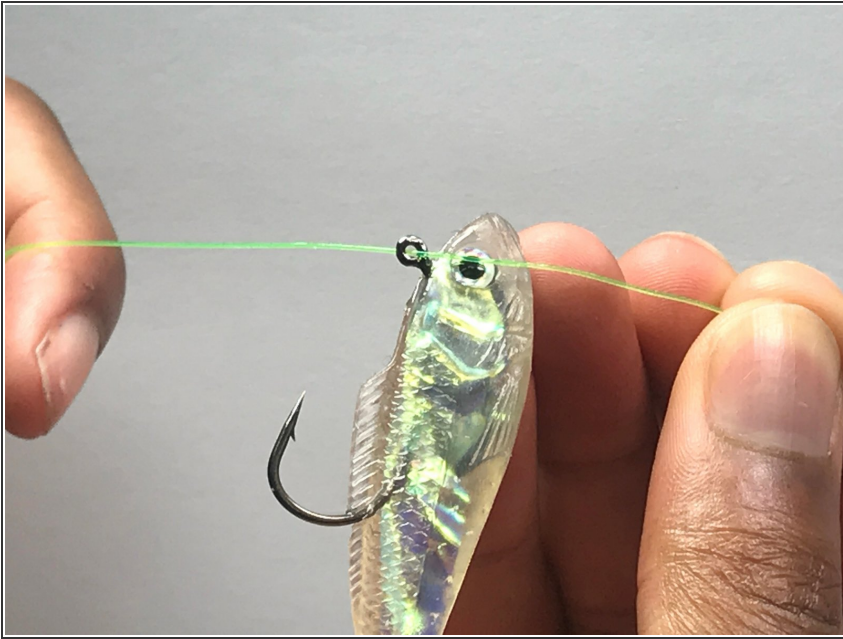

- About one to two feet before the end of the line, thread a weight onto the line.

Step 5

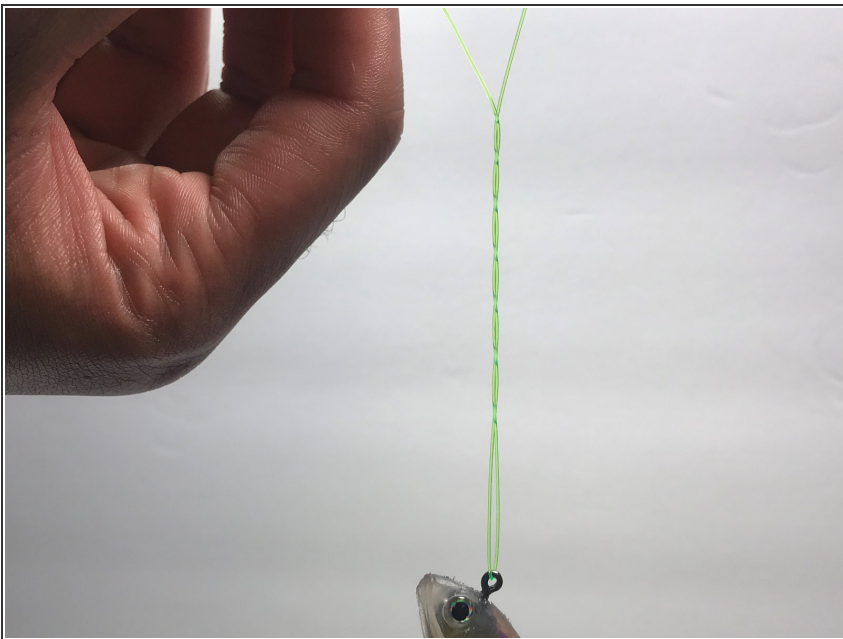

- Tie a knot around the weight's eyelet. (No specific knot needed, it just needs to stay in place.)

Step 6

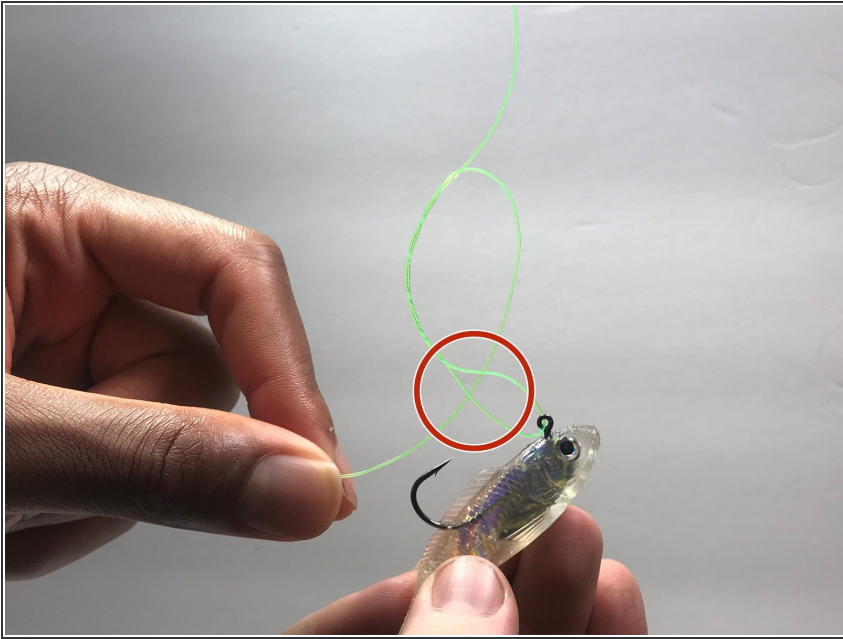

- At the very end of the line, thread the line through the eyelet of the lure about 6 inches.

Step 7

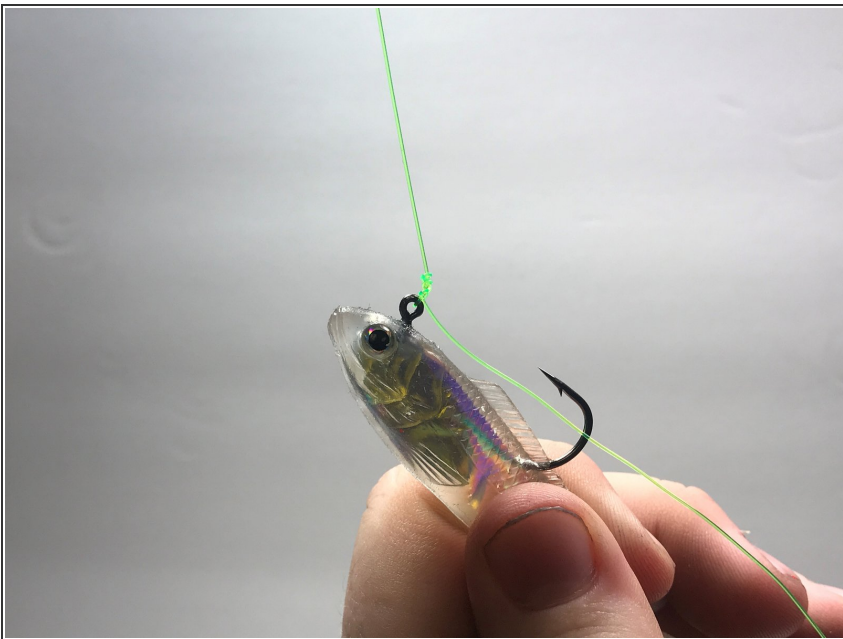

- Twist the line around itself approximately five to six times.

Step 8

- Thread the remaining line through the hole created by the previous step near the lure eyelet.

Step 9

- Pull the knot tight.

After step 9 you are ready to fish.
