

plantronics Voyager pro Battery Replacement

A video that will show you how to replace the battery and a few tips on what not to do.

Written By: Dan Dunham

INTRODUCTION

This is a quick video of how to replace the battery and some of the challenges you will see, what tools you will need, and how easy it is to change it. I made a mistake that you can avoid.

TOOLS:

- [Soldering Iron](#) (1)
 - [Xacto Knife](#) (1)
-

Step 1 — Battery

- order your battery

Step 2

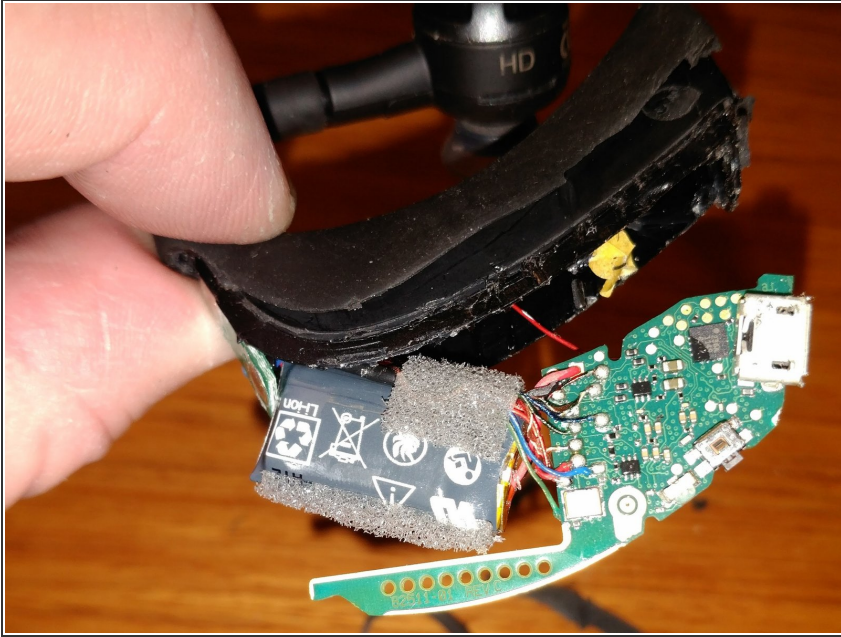

- separate rubber case from back of earpiece. you don't need to remove it completely like I did.

Step 3

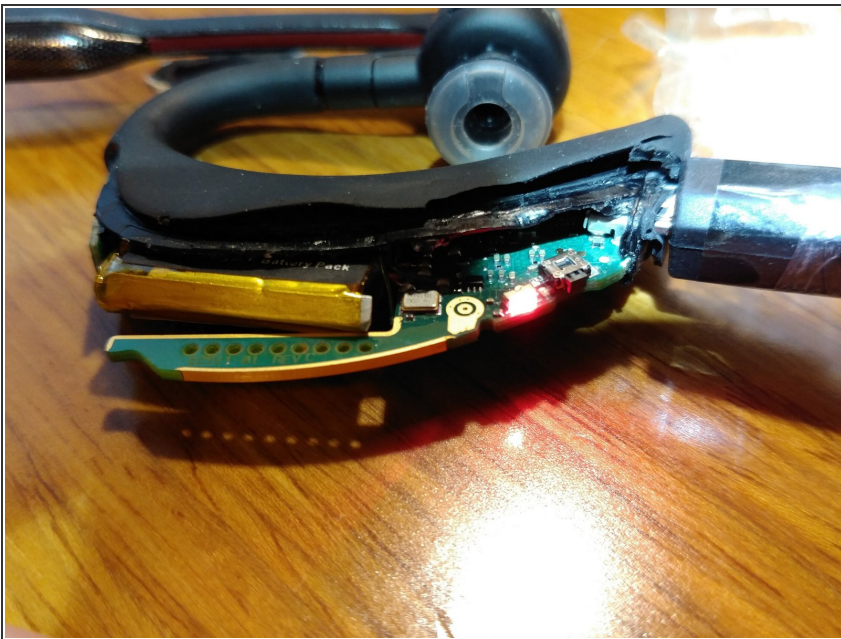

- rotate the back away from the case.
its basically glued in place with no other fasteners

Step 4

- you will need to slowly cut through the foam to separate the wires from the battery. then use a soldering iron to desolder the old battery from the board these connections go through the entire board.

Step 5

- solder the new battery in and test the charging before reassembly.
- the new battery I ordered was slightly larger but it fit with no problems. I found the wires inside this device to be fairly robust and did not have any issues with wires breaking or dislodging.

Step 6

Plantronics Voyager Pro battery replacement

- When I re-assembled I used small amounts of gorilla glue for both the case and the rubber cover. it worked very well and has worked well since. for more details I put together a short video you can check out.

To reassemble your device, follow these instructions in reverse order.
